

Open Catalog Interface (OCI):

Open Icecat XML and Full Icecat XML Repository

Revision date: June 15, 2011, Version 2.34

IMPORTANT NOTES

- 1. In case of Open Icecat, please check the Open Icecat sections.
- 2. The links and files in the download directories are to be downloaded with scripts (from server to server). If you try to download them via your browser, you may sometimes experience memory problems. This does not mean that on our side the data is not accessible or correctly available. In case you experience any problem, contact us via the contact form.
- 3. By default a daily index file is shown when you only enter the directory name. This, because it is more efficient for testing and viewing in a browser. To get the complete index file, include in the path the full file name of the complete index: files.index.xml (in Open Icecat or Full Icecat).
- 4. After a rip of our general site, an IP address may be temporarily blocked. A rip is not acceptable as it may hurt site performance and can be a copyright infringement.

1. Subject of this document

This document describes the Open Catalog Interface (OCI): a set of standards and file formats used in the Icecat XML repository. It gives the basics of how to use the Icecat repository or how to publish data to Icecat conforming the OCI.

Our mission

It is our mission to provide channel partners and buyer orientation websites with high-quality product information via our Open Catalog Interface (OCI). More and more manufacturers work together with Icecat to take care of their product content; this makes it possible for us to distribute their product content for free. Here, you can always find the latest overview of sponsoring (free) brands in Open Icecat: http://www.Icecat.biz/en/menu/partners/index.htm.

However attractive the free Open Icecat database is, the Full-Icecat database still contains many, many more brands: 3000+ (see http://www.Icecat.biz/en/menu/vendors/index.htm). If you are interested in subscribing to the Full-Icecat database, please contact us via the website.

International Standard Supported

XML for the exchange of catalog data
DTD and XSD for the definition of XML schema
The encoding used in our interfaces is UTF8
HTTP for file transfer
Gzip, Bzip2 and Zip for file compression
UNSPSC (see http://www.unspsc.org) for categorization
GTIN / EAN / UPC for logistical product codes (when provided by manufacturers)
ISO 639-1 two character code for languages
ISO 3166-1 two character code for countries
All common graphical formats for images (JPEG, GIF, ...)
Diverse product-specific standards, as mentioned in the feature descriptions.

Open (Icecat) Repositories

The Full Icecat XML repository is a set of product data files and an index file, which includes all pointers to individual product files and gives some basic information like time stamp updated, content quality level, etc. The Icecat XML repository contains product information for products of all brands, and categories that subscribers want us to support. The current content can be best reviewed on the public website: http://www.lcecat.biz/.

Open Icecat repository is the part of the Icecat XML repository that is sponsored by manufacturers and is provided for free to the channel. Open Icecat is distributed under the Open Content License Agreement: http://icecat.biz/forum.cgi?post=3004. Which brands are included in Open Icecat? The most recent list can always be found on the Icecat.biz site: http://www.lcecat.biz/en/menu/partners/index.htm.

Open Icecat is also useful during development and for testing purposes.

OpenIcecat Fair Use Policy

The user of OpenIcecat product data (in a free Open Icecat subscription or as part of the Full Icecat data) is required to respect the OpenIcecat Fair Use Policy, which can be found in the forum: http://forum.lcecat.biz/forum/catalogue/index.cgi?tmpl=view message.html;message id=3004;thread id=17.

Explicitly relevant for website development is:

- to mention explicitly the "(c) Icecat.biz" copyright notice (or "Source: Icecat.biz") on all product data sheets, with a link to the Icecat.biz web site;
- include explicitly the Icecat "AS IS" disclaimer which can be found here:
 http://www.Icecat.biz/en/menu/disclaimer/index.htm (and is available in several languages).

Coverage analysis

To decide to make use of Full Icecat or Open Icecat it may be important to analyze the coverage of your portfolio or the portfolio of your supplier. You can always ask us to give you an overview of the coverage of (stock) portfolio of your suppliers (i.e., distributors) at any given moment. We strive to cover at least 90% of the stock portfolio (stock > 1) of mainstream distributors and work together with partners to monitor this coverage daily.

If you want to analyze coverage, you can do two things:

Register and upload your catalog to Icecat via the Login. In the match analysis you get the match percentages back for Full Icecat and Open Icecat. And you can get a list of the unrecognized products. An advantage is that you can also optionally display your offers -using this method- on the Icecat.biz price comparison sites.

If you do in-depth coverage analyses, please use the following matching file, which is a plain dump of everything in our catalog: http://data.lcecat.biz/prodid/prodid/d.txt (a very large file with all known products in the Icecat database, described and standardized or not). A gzipped version of the matching file can be found here: http://data.lcecat.biz/prodid/prodid/d.txt.gz.

NOTES with regard to the matching file: Market presence=Y indicates that we notice that the product is currently present in at least one distributor's catalog. Quality=Icecat means that Icecat editors have standardized the data-sheet. Quality=SUPPLIER means that the data-sheet is auto-imported from a manufacturer's CMS, and may be queued for standardization. Quality=NOEDITOR means that our editors did not create a data-sheet yet, nor did we auto-import manufacturer data; so, it is only the raw data as we received it from channel partners.

TIP: discuss with the Icecat team a service level for your (supplier's) portfolio.

Advantages of Upgrading to Full Icecat

What are the main advantages of Full Icecat over Open Icecat?

All product data of all 3000+ brands (see http://www.lcecat.biz/en/menu/vendors/index.htm; if you see the brand logo the brand's product data is also available in free Open Icecat).

Coverage guarantees when we monitor your stock portfolio

Support for producing missing data-sheets, categories and brands on request

If you want to upgrade to Full Icecat, you can contact us via the contact form, or click on the "request Full Icecat access" link after the User Login (http://www.lcecat.biz/en/menu/openIcecat/index.htm), or fill in and fax the Full Icecat registration form: http://forum.lcecat.biz/forum/catalogue/index.cgi?tmpl=view_message.html;message_id=3191;thread_id=17 that you can find as an attachment. You will also find in the attached form (pdf) the standard Full Icecat tariffs.

2. Directories

2.1 Access

To obtain access to the repository, you will need a login/password, provided to you by Icecat. If you don't have these, please register online (click on Login) for free Open Icecat.

NOTE: During the registration you need to choose for the URL or XML version. If you want to make use of XML, make sure that you choose the Open Icecat XML subscription. You can always change this afterwards, or create a second subscription for the URL (links to hosted data-sheets) method.

For Full-Icecat access a separate contract is needed. You can request this contract form via info@Icecat.biz.

Take care that you have provided us with the right IP addresses of your content servers, as the access is secured. You can test the login/password combination by entering it by hand in the BASIC HTTP authorization pop-up screen, which appears automatically when the directory URL is entered. In this case, we need to have added the IP address of your workplace as well to your profile. If you don't know this IP address, just type in your browsers http://www.whatismyip.com/ or http://www.getip.com/ and fill it in the IP addresses field after Login via the Icecat website (multiple IPs need to be entered space separated).

Of course, for professional use, server access need to be set up. In case of little experience in this field, we advise you to make use of the URL versions (links to pictures and datasheets) or ask us for assistance.

TIP: for osCommerce – a popular *open source* webshop based on PHP and MySQL – a free lcecat interface is available, which can be downloaded and adapted for your special needs. Here you can find the osCommerce connector, that is supported by http://www.bintime.com/: http://www.oscommerce.com/community/contributions,5294

It is said that this interface works for ZenCart – a sibling of osCommerce – as well. Look in our Forum for interfaces to other *open source* solutions like Magento and Batavi, or proprietary ecommerce solutions.

2.2 Individual Product XML (Meta) Requests (Real-Time)

For smaller catalogs and for testing XML with small data-sets, it may be handy to make use of our real-time interface (URL2XML) for retrieving Product XML from the (Open) Icecat repositories.

The general format of the call is:

http://data.lcecat.biz/xml_s3/xml_server3.cgi?prod_id=<prod_id>;vendor=<vendor_name>;lang=<lang>;output=<output>

or

http://data.lcecat.biz/xml_s3/xml_server3.cgi?ean_upc=<EAN or UPC>;lang=<lang>;output=productxml

Where:

prod_id – the manufacturer part number of the requested product, vendor name – name of the manufacturer of the requested product,

ean upc - the EAN or UPC code to identify a product,

lang – the language code (INT – for the international/standardized repository, EN, NL, FR... - for local ones, see section 2.4), output – the type of the response. It can be productxml (the product xml file) and metaxml (the index or meta information on the Brand + ProdID/M_Prod_ID or EAN/UPC).

For example, if you need to get an xml file of product 'Compaq 6710b Base Model Notebook PC'. Manufactured by HP, with part number RJ459AV, in English:, the call will be:

http://data.lcecat.biz/xml s3/xml server3.cgi?prod id=RJ459AV;vendor=hp;lang=en;output=productxml

In case you want to retrieve data on the basis of an EAN or UPC code.

http://data.lcecat.biz/xml s3/xml server3.cgi?ean upc=4960999358246;lang=en;output=productxml

An example of the international (standardized) version of Canon 1447B006AA:

http://data.lcecat.biz/xml s3/xml server3.cgi?prod id=1447B006AA;vendor=Canon;lang=int;output=productxml

The meta data:

http://data.lcecat.biz/xml s3/xml server3.cgi?prod id=1447B006AA;vendor=Canon;lang=int;output=metaxml

The English version (with for some brands localized data-sheets):

http://data.lcecat.biz/xml_s3/xml_server3.cgi?prod_id=1447B006AA;vendor=Canon;lang=en;output=productxml

The German version (with for some brands localized data-sheets):

http://data.lcecat.biz/xml s3/xml server3.cgi?prod id=1447B006AA;vendor=Canon;lang=de;output=productxml XML Server 3 access works via the basic HTTP authorization, also used for other HTTP requests.

TIP: Use the Presentation_Value parameter in localized data-sheets for display of a data-sheet, and use the standardized Value parameter (from INT, and in the local data-sheet) for search & compare on standardized values.

2.3 Open Icecat (free) directories, for batch processing

Open Icecat users have access to:

http://data.lcecat.biz/export/freexml.int/INT/ for access to the standardized data files (QUALITY=Icecat).

TIP: The standardized files are advised for searching & comparing.

Please, note, where QUALITY = SUPPLIER only the original product data as imported from a manufacturer's CMS is available, the respective data-sheet is not yet standardized by our editors. When it is standardized the parameter is changed to QUALITY = lcecat.

The language-specific data-files are found here:

http://data.lcecat.biz/export/freexml.int/<code>/<product_id>.xml, where <code> stands e.g. for NL, EN, FR, DE, IT, ES, DK etc. For the used codes see section 2.4.

Please, note that this language-specific content can be either the standardized content (sames as in INT), which is entered by our editors, or – even better – the original data imported from the CMS of a manufacturer like HP, Toshiba, Philips etc.

In general, we follow the ISO 639-1 two character code, except when a code is not specified like is the case with US English, here we will use the country code is not in conflict.

TIP: We advise the language-specific product content (Presentation_Value) purely for the display of product data-sheets, not for search & compare. For search & compare, we advise the standardized product content of the Value parameter from the /INT or local language directory.

TIP: Open Icecat is also useful for testing purposes before you upgrade to Full Icecat. The technical structures are 100% compatible with those of Full Icecat.

2.4 Full Icecat directories, for batch processing

Full Icecat contains all product data of all 2500+ brands supported. Often provided with service levels and coverage guarantees.

For the Full Icecat subscribers, a separate directory structure is in place. The standardized files are located at: http://data.icecat.biz/export/level4/INT

TIP: The standardized files are advised for searching & comparing.

Please, note, where QUALITY = SUPPLIER only the original product data as imported from a manufacturer's CMS is available, the respective data-sheet is not yet standardized by our editors. When it is standardized the parameter is changed to QUALITY = lcecat.

and the language dependent versions are found here:

http://data.lcecat.biz/export/level4/<code>/<product_id>.xml, where <code> stands e.g. for NL, EN, FR, DE, IT, ES, DK, etc. For the full list of used codes see section 2.4.

Please, note that this language-specific content can be either the standardized content (same as in INT), which is entered by our editors, or – even better – the original data imported from the CMS of a manufacturer like HP, Toshiba, Philips etc.

TIP: We advise the language-specific product content (Presentation_Value parameter) purely for the display of product data-sheets, not for search & compare. For that, we advise the standardized product content (the Value parameter) in both the /INT and the respective local language directories.

Examples:

http://data.lcecat.biz/export/level4/EN http://data.lcecat.biz/export/level4/NL http://data.lcecat.biz/export/level4/FR http://data.lcecat.biz/export/level4/DE http://data.lcecat.biz/export/level4/IT http://data.lcecat.biz/export/level4/ES http://data.lcecat.biz/export/level4/DK http://data.lcecat.biz/export/level4/SE http://data.lcecat.biz/export/level4/RU http://data.lcecat.biz/export/level4/CZ http://data.Icecat.biz/export/level4/ZH http://data.lcecat.biz/export/level4/FI http://data.lcecat.biz/export/level4/PL http://data.lcecat.biz/export/level4/BG http://data.lcecat.biz/export/level4/TR etc

In general, we intend to follow the ISO 639-1 two character code.

2.5 Languages Supported and their Codes

If you want to know if your country/language is supported look here online for the latest status: http://www.lcecat.biz/index.cgi?language=en;menu=country|language

We currently support most world languages and European languages. Our intention is to support eventually all languages.

In general we follow the language codes as given by the ISO 639-1 standard. See http://en.wikipedia.org/wiki/List of ISO 639-1 codes. However, in some cases, we will choose for the two character country codes when for the "country-specific dialect" there is no language code given (e.g., BR for Brazilian-Portuguese, or US for US English).

In total we support now more than 20 world languages. If you feel that your language or the language that you need is missing, feel free to contact us. Probably we can work something out.

Used codes in Icecat:

INT – International standardized version of a data-sheet. When QUALITY = Icecat language independent values.

EN – Standard or UK English

US – US English

NL - Dutch

FR – French

DE – German

IT - Italian

ES – Spanish

DK - Danish

RU - Russian

PT - Portuguese

ZH - Chinese (simplified)

SE – Swedish

PL - Polish

CZ - Czech

HU – Hungarian

FI - Finnish

NO - Norwegian

TR – Turkish

BG - Bulgarian

KA - Georgian

RO - Romanian

SR - Serbian

```
JA – Japanese
UK – Ukrainian
CA – Catalan
HR – Croatian

Planned:
TW – Chinese (traditional)
BR – Brasilian Portuguese
```

2.6 Use Gzip / mod_deflate

As files becomes bigger and bigger, and the number of files is growing fast, we support the gzipping of all interface files. In stead of doing this per file individually, we applied gzipping to all interface files automatically (mod_deflate). To benefit from it, you have to add one parameter to your calls.

About mod_deflate:

mod_deflate transports our interface files as compressed gzip data, but will show it transparantly in its original format in modern browsers.

To benefit in your server scripts from gzip, you must use in any HTTP request this additional parameter:

Accept-Encoding: gzip

It will enforce gzipping!

Example:

GET /export/level4/INT/10.xml HTTP/1.1

Host: prf.Icecat.biz Accept-Encoding: gzip User-Agent: Firefox/1.0

2.7 Use of HTTP like FTP, and an example C# script to download files

We often get questions like can we use FTP instead. Actually, this is really not necessary as http has very similar capabilities to FTP. One can use the following format: http://username:password@sitename

Here is example code in C# to download files (it can be used also in ASP.NET code). It is tested and works ok:

```
public static Byte[] DownloadIcecatFile()
{
    string strDownloadURL = "http://data.Icecat.biz/export/freexml.int/INT/480237.xml";
    string strUser = "Your Login to Icecat Repository";
    string strPWD = "Your Password to Icecat Repository";
    // Creating an instance of a WebClient
    WebClient req = new WebClient();
    // Creating an instance of a credential cache,
    // and passing the username and password to it
    CredentialCache cache = new CredentialCache();
    cache.Add(new Uri(strDownloadURL), "Basic", new NetworkCredential(strUser, strPWD));
    req.Credentials = cache;
    Byte[] fileData = req.DownloadData(strDownloadURL);
    return fileData;
}
```

In Classic ASP, MSXML2.ServerXMLhttp can be used

Some details are present here: http://msdn.microsoft.com/en-us/library/ms766431%28v=vs.85%29.aspx

3. Index files *.index.xml

3.1 Purpose

The purpose of the index files is to find the right Icecat number and thus product xml files for a given product. The "key" is always Brand + Manufacturer Part Number.

New:

We added also EAN / UPC codes as unique identifiers.

Also the list of distributor part numbers is present if available.

Plus an indicator if a product is on the market still or obsolete.

And the markets/countries where we daily see that the product is live.

There are four types of index files in our XML-OCI:

- an index file with references to all product data-sheets in Icecat or Open Icecat, also historical/obsolete products (*/files.index.xml)
- a smaller index file with only references to the new or changed product data-sheets of the respective day (*/daily.index.xml)
- an index file with only the products that are currently on the market, as far as we can see that based on 100s of distributor and reseller price files (*/on_market.index.xml or .csv)
- an index file with the products that are or were on the market for which we only have basic market data, but no complete data-sheet (*/nobody.index.xml or .csv)

The complete Full Icecat index file is located at http://data.Icecat.biz/export/level4/INT/files.index.xml

or per language code: http://data.lcecat.biz/export/level4/code/files.index.xml ,

Example: http://data.lcecat.biz/export/level4/EN/files.index.xml, where <code> stands e.g. for NL, EN, FR, DE, IT, ES, DK, RU, ES, SE,... For the complete list see section 2.4.

Similarly the index file with changed or new product references is found at

http://data.lcecat.biz/export/level4/INT/daily.index.xml

or per language code: http://data.lcecat.biz/export/level4/code/daily.index.xml , where <code stands e.g. for NL, EN, FR, DE, IT, ES, DK, RU, ES, SE,... For the complete list see section 2.4.

or in case of Open Icecat the complete index file can be found here: http://data.lcecat.biz/export/freexml.int/<code>/files.index.xml, where <code> stands e.g. for NL, EN, FR, DE, IT, SP, DK, RU, ES, SE,... For the complete list see section 2.4.

Similarly the index file with changed or new product references is found at http://data.lcecat.biz/export/freexml/daily.index.xml or per language code: <a href="http://data.lcecat.biz/export/freexml.int/<code">http://data.lcecat.biz/export/freexml.int/<code >/daily.index.xml , where [code] stands e.g. for NL, EN, FR, DE, IT, SP, DK, RU, ES, SE, ... For the complete list see section 2.4.

It includes the index information for each product and gives the path to the xml product file. Below is an example of a file tag in the index file:

```
<file path="export/level4/INT/344.xml" Product ID="344" Updated="20091031192020" Quality="Icecat" Supplier id="29" Prod ID="WD400BB" Catid="219"
On_Market="1" Model_Name="WD Caviar 40GB EIDE, 100 MB/s, 2 MB, 7200 RPM" Product_View="25508">
  <M_Prod_ID>WD400BB?1PK</M_Prod_ID>
  <M_Prod_ID>WD400BBRTL2</M_Prod_ID>
  <EAN_UPCS>
   <EAN UPC Value="0718037719696"/>
   <EAN_UPC Value="2000006035103"/>
   <EAN_UPC Value="4005922164744"/>
   <EAN_UPC Value="5400853050002"/>
   <EAN UPC Value="8032976016497"/>
   </EAN_UPCS>
   <Country_Markets>
   <Country_Market Value="AT"/>
   <Country_Market Value="DE"/>
   <Country_Market Value="ES"/>
   <Country_Market Value="FR"/>
   <Country Market Value="IT"/>
```

```
<Country_Market Value="NL"/>
<Country_Market Value="SE"/>
<Country_Market Value="UK"/>
<Country_Market Value="US"/>
</country_Markets>
</file>
```

The On_Market attribute indicates that a product is still on the market (On_Market="1") or not seen on the market anymore (On_Market="0"). Per product also the EAN or UPC codes that are used for logistical purposes are given. It is possible that there are multiple EANs or UPCs, because depending on packaging or importers different codes are given. Further, the part number variants that are used in the market are given in a sub list (M_Prod_ID).

Finally, the <Country_Market Value="US"/> indicates that we see the product at the moment in the catalogs of US channel partners. This tag can be useful to limit your view on the index file, in case that you don't have distributor imports to do that.

The new Model_Name and Product_View attributes were added. The Model_Name attribute contains the product name, the Product View attribute indicates how many times the current product was requested.

files.index.xml and daily.index.xml are refreshed every day by us. You can use daily.index.xml to update only the data in your local database that has changed or is new in the Icecat database. Files.index.xml, you can use the first time for a full import of needed product information, and for the regular analysis of coverage of your product database.

TIP 1: download ONLY the xml files that you actually need for your shop or application by using the daily export from your ERP or shop (or actually the daily imports from your distributor/suppliers) as a filter. It is useless to import all the EMEA/Worldwide data files, if you only operate in one geographic area or have an assortmet limited to a certain category.

TIP 2: check the timestamps to only download files that have changed or check only for new files, to improve update performance cycles.

TIP 3: use the on_market index file, in case that you think the full index file is too big for you to process or too inefficient. DISCLAIMER: if our monitor for your market is incomplete, the use of the on_market index file is very limited.

TIP 4: in case that you want to recategorize your products, also for products for which we have no data-sheet (QUALITY=NOEDITOR), make use of the nobody index file.

TIP 5: daily index file has the list of yesterday removed products (QUALITY=REMOVED). Products can be removed as duplicated or historical and inactive. You can use it for your catalogue cleaning.

3.2 *.index.xml DTD

The latest version of the DTD can be found here: http://data.lcecat.biz/dtd/files.index.dtd

```
<!ELEMENT Icecat-interface (files.index)+>
<!ATTLIST Icecat-interface
                   xmlns:xsi CDATA #IMPLIED

Value CDATA #REQUIRED>

Each product has its own data file in xml format. Its location is defined by the attribute "path" in the *.index.xml. The file content includes all the available product information for the respective product.

The "Prod_ID" attribute is a manufacturer's unique identifier for a product, often called Manufacturer Part Number (code de fabricant, Produkt-Kode, artikelnummer, etc). In combination with the "supplier_id" it is the unique key to select a product's XML file via Icecat's internal identifier ("Product_id").

M_Prod_ID are one or more manufacturer part numbers which were used by distributors/channel partners, but are mapped away to the original (correct) Prod_ID.

The EAN_UPC sub-list lists the GTIN codes (EAN or UPC) that are connected to this product. There can be multiple codes, as these are logistical codes depending on packaging types and geography.

On_Market (1=Yes, 0=No) indicates whether a product is somewhere seen on the market by Icecat. The Country_Market lists the individual markets (countries), where Icecat sees that the product is present. This indication can be used to limit the view on our index file.

DISCLAIMER: Our market view is always imperfect as we depend on the data of connected channel partners and distributors.

Catid is Icecat's internal category identifier. Catid="151" referes to Notebooks. For every category there is a second, external, category identifier based on UNSPSC. In the reference files or the product xml the meaning of categories can be found.

"Quality" attribute values:

SUPPLIER

The content is received from a supplier CMS, but not standardized by an Icecat editor. The language-specific directories are likely to contain the full (unstandardized) data-sheet.

Icecat

The content is entered or standardized by Icecat editors. The standardized data can be found in the INT directory and the language-specific directories.

NOEDITOR

The content is received from a merchant (in most cases one of the 100s of distributors we are daily "polling") and may be parsed. Editors haven't described this product yet. The NOEDITOR data is not exported in XML to 3rd parties.

4. Additional data

4.1 Manufacturer names mapping data

To help you with matching distributor data to the Icecat rich content, we are publishing the mappings of used variants of manufacturer names to the Icecat Supplier_ID.

You can find this file in your repository, named supplier_mapping.xml.

Within this file you'll find the match between different manufacturer names variations and the original manufacturer name.

The format is self explanatory. The DTD for the message format is is available at: http://data.lcecat.biz/dtd/lcecat-supplier-mapping.dtd

4.2 Manufacturer part number mappings

Different distributors often produce different manufacturer part numbers (MPN) for the same product.

To help you correct the MPNs from different distributors and to help you to get the best coverage, we are publishing the available MPN mappings to the official MPN.

In every repository directory, the file with product mappings is published in the index files (files.index.xml etc).

OBSOLETE METHOD product_mapping.xml: INT/product_mapping.xml EN/product_mapping.xml etc...

We advise *not* to use product_mapping.xml files anymore as it has an obsolete structure, and all product mapping data is already integrated in the XML index files.

4.3 References

In product XML feeds, you will find a lot of structures, which are included as references in the product data files, e.g. categories, features, measures (units) etc.

The reference files can be found in the /refs/ subdirectory. For example, for Full Icecat, at http://data.Icecat.biz/export/level4/refs/ and for Open Icecat at http://data.Icecat.biz/export/freexml/refs/ at http://data.Icecat.biz/export/freexml/refs/ and <a href="http://data

The included files (entities) are:

CampaignsList.xml (with the documentation)

CategoriesList.xml.gz

CategoryFeaturesList.xml.gz

FeaturesList.xml.gz

LanguageList.xml.gz

MeasuresList.xml.gz

RelationsList.xml

SupplierProductFamiliesListRequest.xml.gz

SuppliersList.xml.gz

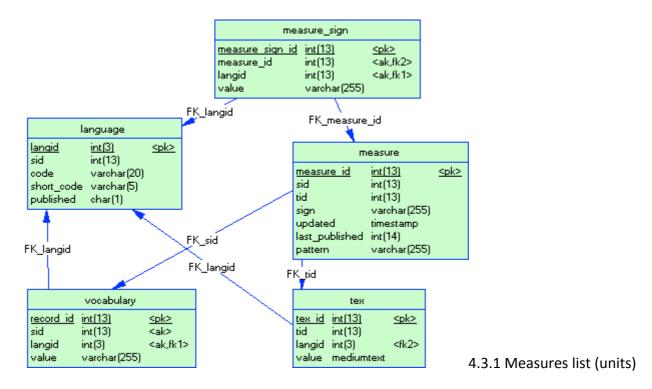

FeatureValuesVocabularyList.xml.gz (translations of certain frequent feature values)

SuppliersList.xml.gz	2009-11-06 03:5	9 44K

Almost all files are present in Gzipped format. Typical use of the files is in combination with data from the INT (international) directory, not the localized directories as there the language-specific values are already automatically applied to the product XML files.

Note: The single file with all references, refs.xml, is actually replaced by the above-mentioned directory, as the refs.xml file became too big to handle easily.

Example:

Example:

4.3.3 Categories list

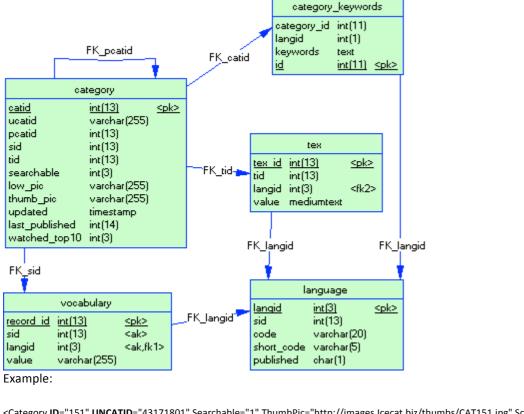

This chunk provides the information on categories which are used in the Icecat environment and for product categorization. Each category may be either searchable or not. Searchable categories may be used for product lookup by product feature values, as Icecat editors are systematically maintain data integrity to allow smart searches.

Explanation to values of the "Searchable" attribute:

Value Explanation

- 1 This category may be used for product lookup in product list lookup request
- O This category is not made searchable (in our own product finder tools)

[&]quot;Score" attribute in the response reflects the category usage statistic. The higher number means the higher usage level.

4.3.4 Suppliers list request (manufacturers)

Example:

4.3.5 Category features list request

This chunk provides information about features which are assigned to a every certain category and which are used for describing products in the category.

Each searchable feature will have LimitDirection attribute defined, which will give an advice for finding a "better" feature value, either \leq or \geq . E.g. for feature "Hard disk capacity" it would be \geq relation, and for the feature "Write seek" it would be \leq relation.

"LimitDirection" attribute values explanation:

Value Explanation

- 0 The relation is undefined
- 1 The relation is \leq

- 2 The relation is \geq .
- 3 The relation is =

"Class" attribute values explanation:

Value Explanation

0 Key feature

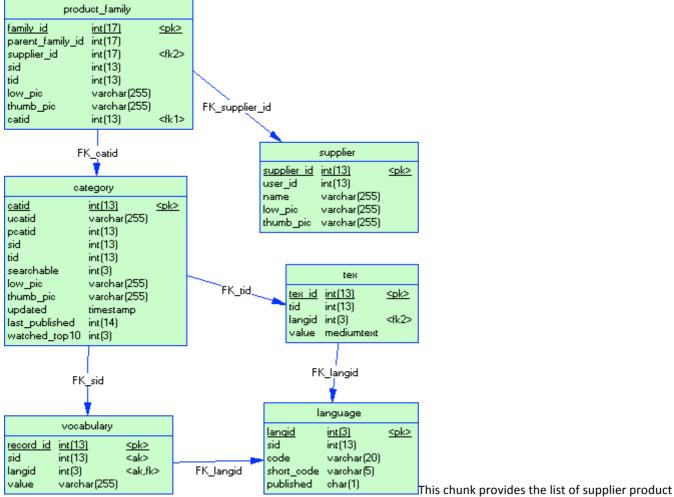

1 Extra feature – tech details

Possible feature values may be restricted to a limited set of value. In that case possible values for combination Category-Feature are listed into container RestritedValue.

Example:

```
<Category ID="559" UNCATID="45111601" LowPic="">
                                 feature
                                                                                                                       category_feature_group
                                                                                                category feature group id int(13) <pk> int(13) <pk> int(13) <a href="mailto:sak,fk1"><a href="ma

4.3.6 Supplier product families list request

families. Each product family may have information about it's Name, Description in different languages, and category.

4.3.7 Languages list

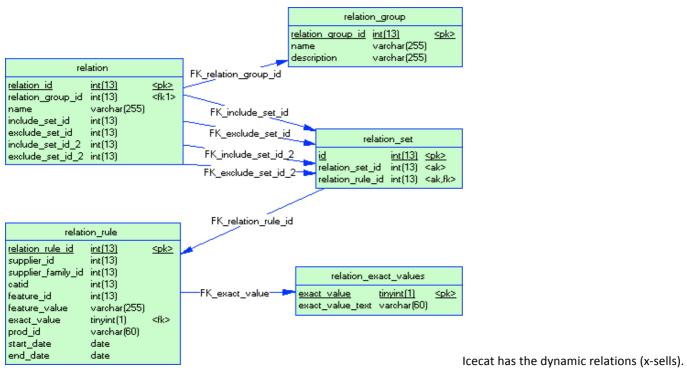

Example:

For the used language codes see section 2.4

4.3.8 Relations list

<Name ID="9512" Value="TravelMate series" langid="1"/>
<ParentProductFamily ID="1"/>

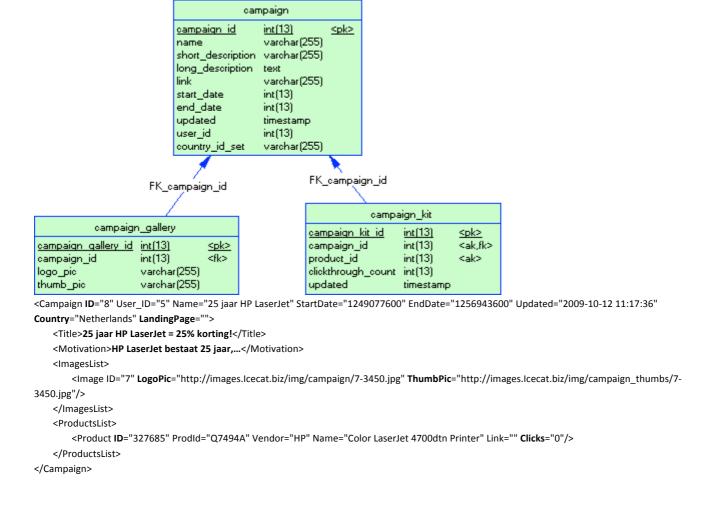

</ProductFamily>

They based on the product sets, manually defined. One product set relates to another one.

4.3.9 Campaigns list

Brand products can have campaigns for specific period. CampaignsList.xml has the list of all assigned campaigns.

4.3.10 Popularity of products

All Icecat product requests (real-time requests by end-users and xml requests) are logged. This data gives a product popularity indication which can be used to sort products and to analyze trends as input for marketing decisions. This popularity data is daily published on: http://data.lcecat.biz/export/level4/data prod stat.xml

4.3.11 Standardized Product Summary Description

In response to questions from different clients, we have created a Standardized Product Summary Description.

The International version is to be found here:

http://data.lcecat.biz/export/level4/INT/product overview.txt

http://data.lcecat.biz/export/level4/INT/product_overview.txt.gz

Where column 1 is the Icecat ID, and column 2 and 3 give a short and a long standardized product summary description.

```
The short summary of column 2 is created as follows:
```

<brand name> + <Model name> + + color family, if present> + <key feature value 1..5 + unit>

The extened summary of column 3 is created as follows:

<brand name> + <Model name> + + coduct family, if present> +

<name feature group 1> + <related key feature values + units>

<name feature group ..> + <related key feature values + units>

<name feature group n> + <related key feature values + units>

The local versions can be found here:

http://data.lcecat.biz/export/level4/<language_code>/product_overview.txt

http://data.lcecat.biz/export/level4/ code>/product overview.txt.gz

TIP: Think about the guarantees that you get from your suppliers (distributors), based on errors made in their product descriptions. It may still be smart to make use of these supplier (distributor) texts in the ordering process for this reason.	

5. Product XML data file

5.1 Repository file DTD

The XML repository files comply to the standard Icecat XML response DTD, which is located at http://data.Icecat.biz/dtd/Icecat-interface response.dtd

Please, note that the tag "No=" (example: No="100090") is a Priority indicator. The higher the number the more important the feature or feature group is considered to be for buyer orientation. We advise you to sort features and feature groups by priority, to get a more customer friendly user presentation.

Product code is a deprecated field, eariler it used as product response status. Now, product code always equals 1.

5.2 XML Schema definitions

Each Icecat XML has its XSD definition, you can see it as 2 mandatory attributes in the root XML tag. The basic information about XML Schema - http://en.wikipedia.org/wiki/XML Schema %28W3C%29. Icecat XSD sources are located at http://data.lcecat.biz/xsd/. They can be used for Icecat XMLs validation.

5.3 Example product XML

```
<?xml version="1.0" encoding="UTF-8"?>

<SummaryDescription>

<Name ID="10161" Value="AMILO D" langid="1"/>

Some notes:

- the Reverse attribute for product relations is obsolete and can be ignored.
- Presentation_Value is the processed value as can be displayed in a data-sheet. It is based on the
 international (but localized) feature value with the localized measure unit or if the international value is
 absent on the language-specific value.
- ProductSummaryDescription the new data structure, collected from the product feature names & values.
 ShortSummaryDescription has: product name, product family and 1st 6 feature values.
 LongSummaryDescription has product name, product family and the list of feature group name with the feature values.

6. SQL set-up

6.1 Explanation of entities

Below on entity level, follows a short description of the entities used in our data model.

Category – table that holds the category structure information. Category names can be found in 'vocabulary', referenced via the 'sid' key

Category feature - link between feature and category

Category feature group – a group that holds a number of category features, to group them for display

Category keywords – category keywords that can be used for a search

Feature – holds the information about the features available for product description

Feature group - a generic features groups available in Icecat

Language - identifier of the language of a data element

Measure - units, e.g. meter, megabyte etc

Product – main information about the product

Product bundled – in case that a product is a distri bundle, info about components is here

Product description - language specific description

Product family - product lines families per supplier & category

Product feature – product specs features are here. resolution of features/measures is via - > category_feature -feature -> measure

Product gallery – some more product images

Product multimedia object – place for storing multimedia data, like swf, animated gifs, etc

Product related product cross-sell-relations or alternatives are stored here. The type of link can be determenined by categories. e.g. if the categories are the same -> link gives an "alternative". Categories are different -> link is "option".

Sid index – table for holding the autoincrement index for the vocabulary. needed only in case of issuing new records to the vocabulary

Supplier - manufacturers are stored in this table

Tex - vocabulary for large data elements

Tid index - index of tex table

Vocabulary – table for storing misc language dependent data

6.2 MySQL Set-Up (monolingual catalogue)
